From a 30 m image patch to one site-local depth estimate

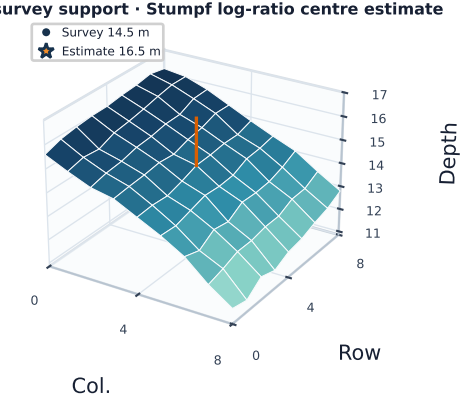

Coastal scene and selected pixel patch

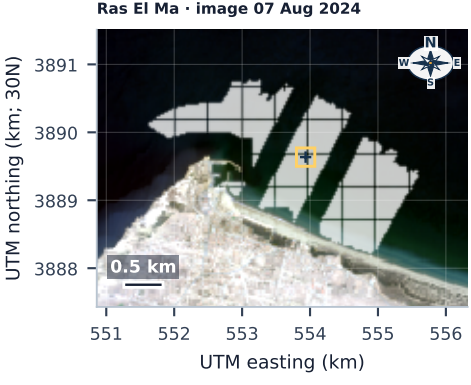

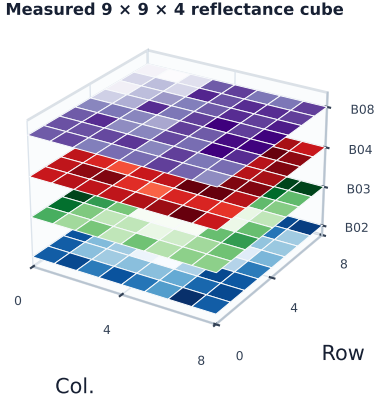

Nine-by-nine input · four HLS bands

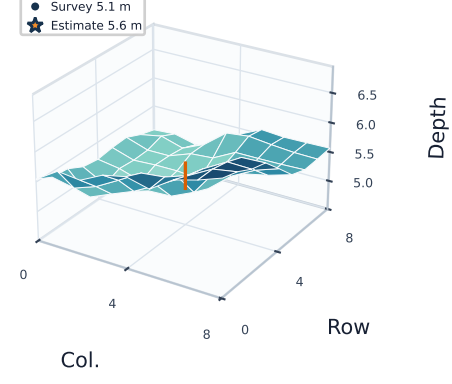

Nine-by-nine survey support · one centre output

The outlined image window is 270 × 270 m (9 × 9 HLS pixels). Band colours show measured reflectance, scaled separately within each band. The 3D neighbourhood shows aggregated survey labels; only the central star is a saved held-out model estimate. Vertical axes are schematic and exaggerated.
